Wireshark Developer and User Conference

Packet Optimization & Visibility with Wireshark and PCAPs

Gordon Beith

Director of Product Management

VSS Monitoring

Market Trends - Innovation

MOBILE LTE

**INFRASTRUCTURE
COMPLEXITY**

**BIG DATA
BUSINESS INT**

**CYBER
SECURITY**

- In a hyper connected world, one must master the trends of cloud, virtualization, SDN, media, mobile, business intelligence while overcoming security threats.
- This makes Network, Application, and Security monitoring and analysis tools critical to have...

Monitoring & Analysis Challenges (1)

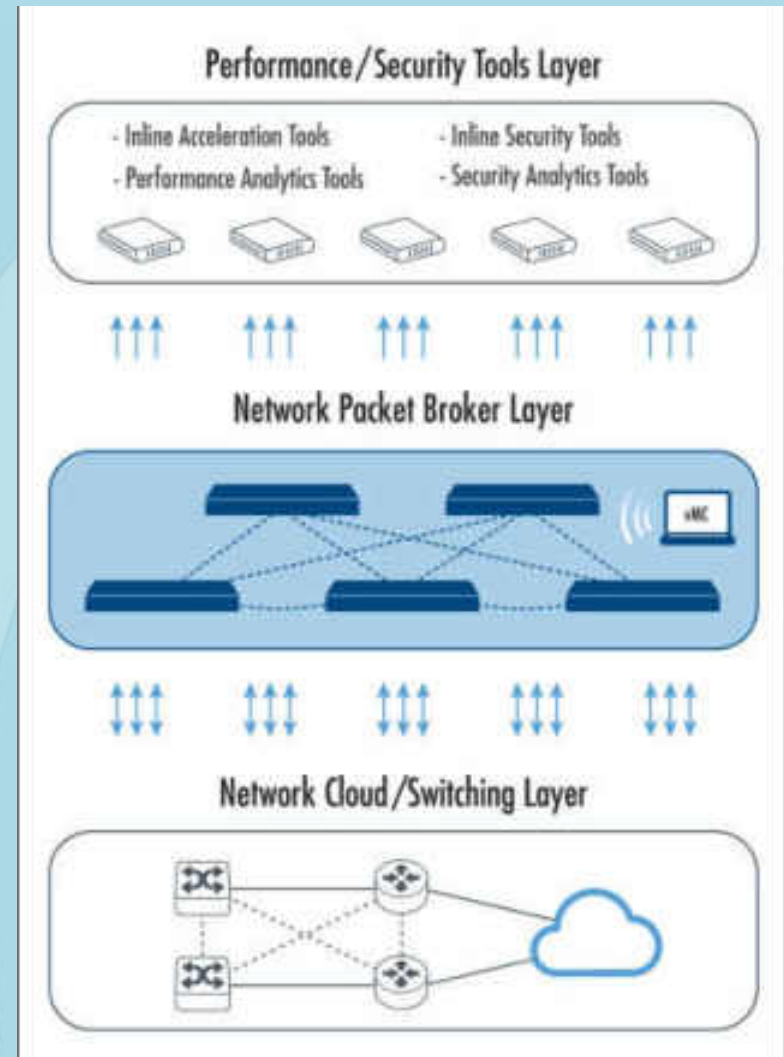

- Access to all key points in the network
 - Is a tool (e.g. Wireshark) instance at every point realistic?
 - Costly to install and maintain
 - Difficult to manage across different locations
 - Won't get full picture/session, e.g. asymmetrical routing
 - High speeds, e.g. 40G, & 100G, probably not accessible
- Visibility to all required packets from the network
 - Can a single tool instance handle all traffic?
 - Total bandwidth is too much for NICs and processors
 - Each instance of a tool probably doesn't need to see all traffic
 - Can a specific tool understand all protocols?
 - Tunneling and virtualization protocols often not supported nor interesting
 - Encrypted traffic content typically not accessible to tools

Monitoring & Analysis Challenges (2)

- Scalability of Tools
 - How can a tool scale to meet increasing traffic and number of networks?
 - Next to impossible without faster processors, bigger disks, and more/higher-end NICs
 - Impacts of Bursty Traffic
 - How can effects of microbursts be mitigated?
 - Needs to be done in the aggregation hardware to avoid packet loss
 - Governance and Legal Compliance
 - In what ways can tools comply with HIPPA, LI, PCI, SOX, etc.?
 - Very difficult without programmable hardware pre-processing in tool
- Employ Network Packet Brokers!

What are Network Packet Brokers?

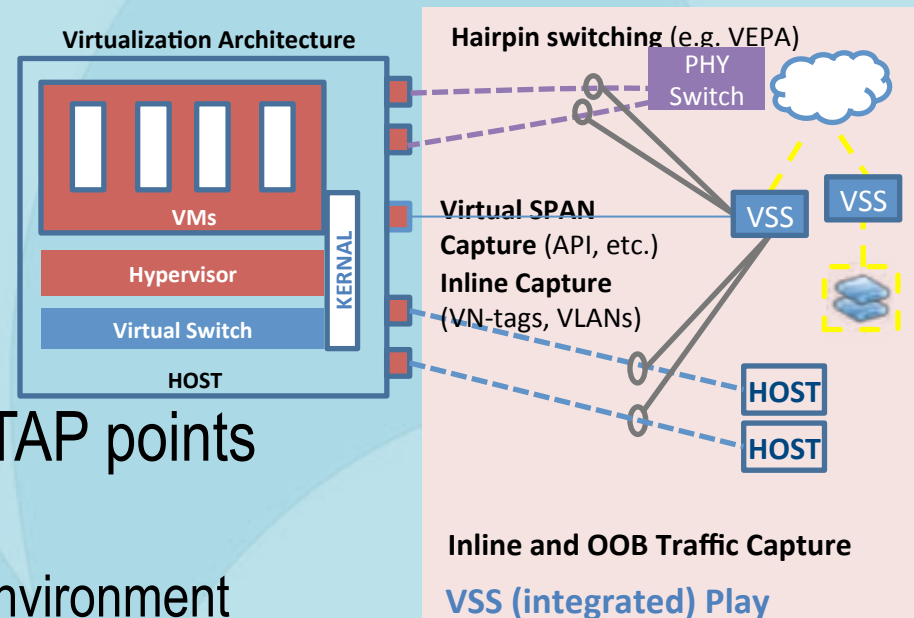

- A newer type of network appliance
- Sits between network and intelligence tools
- Captures network traffic at line rate
- Grooms packets ready for network intelligence tools
- Forwards packets to network intelligence tools

Addressing the Challenges with NPBs (1)

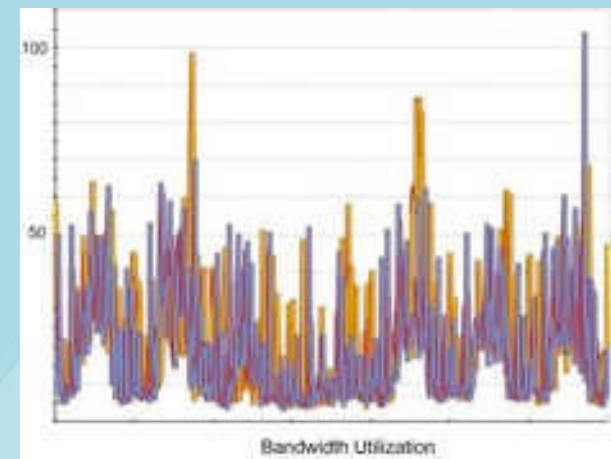

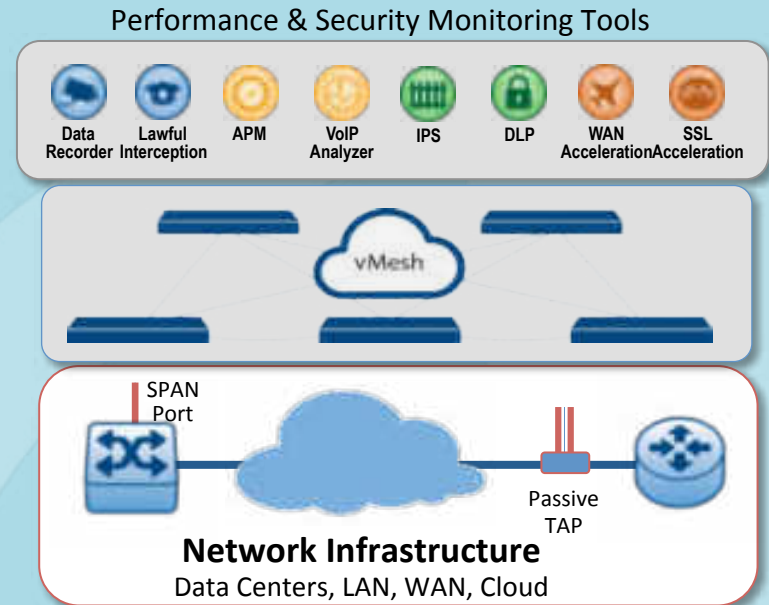

- Network & Traffic Access
 - Deploy network TAP appliances wherever possible
 - Remove Mirror/SPAN port contention
 - Ensure reliability of data access
 - Use Mirror/SPAN ports on switches/routers if no other choice

- Employ virtual Mirror/SPAN/TAP points within virtual environments
 - Direct traffic out from virtual environment

Addressing the Challenges with NPBs (2)

- Traffic Delivery Optimization
 - Deploy Network Packet Brokers (NPBs) as a complete system
 - Either as a second tier or with TAPs integrated
 - Selective aggregation from access towards monitoring tools
 - Filter traffic based on layers 2 to 7, with/without tunneling
 - Balance traffic across multiple tools maintaining session integrity
 - High availability & redundancy
 - Include Microburst Detection & Mitigation
 - Visibility to granular traffic profile for network capacity planning
 - Ensure delivery of all monitored packets despite microbursts

Addressing the Challenges with NPBs ⁽³⁾

- Packet Optimization ⁽¹⁾
 - Port and Time Stamping
 - Visibility to packet's source link and time of occurrence
 - Accuracy is important
 - Protocol De-encapsulation/Stripping
 - Remove unwanted/unsupported protocol headers from monitored packets, e.g. GTP tunnels, MPLS labels, VLAN tags, VN-tags
 - Conditional Slicing
 - Remove unwanted/undesirable data from specific packets
 - Support regulatory and legal compliance

Addressing the Challenges with NPBs (4)

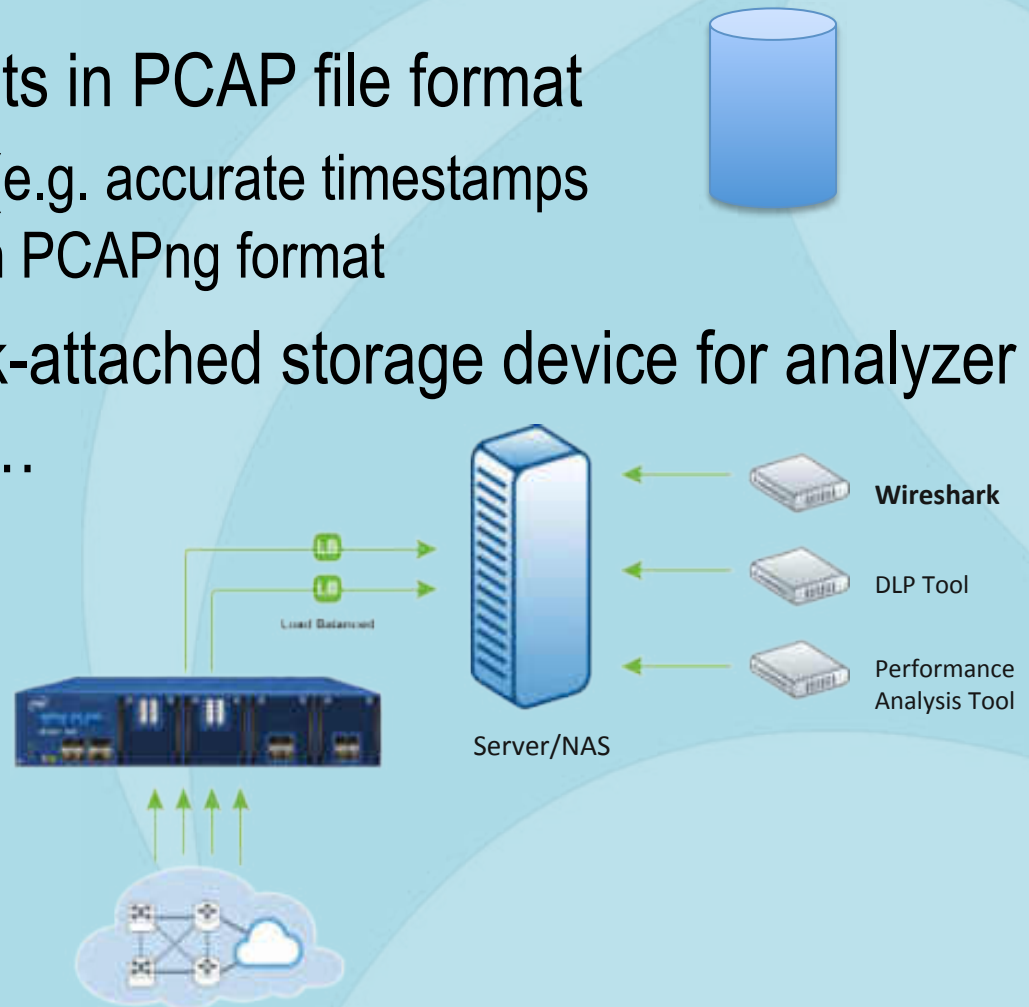

- Packet Optimization (2)
 - De-duplication
 - Minimize bandwidth required for delivery
 - Improve on tools' efficiency and accuracy
 - Fragment Reassembly
 - Facilitate flow/session-based balancing and filtering of traffic
 - Improve tool efficiency and accuracy
 - SSL Decryption
 - Visibility into encrypted traffic

Addressing the Challenges with NPBs (5)

- PCAP Creation Optimization

- Encapsulate packets in PCAP file format
 - Include metadata (e.g. accurate timestamps and source port) in PCAPng format

- Forward to network-attached storage device for analyzer tools to access, or... stream to tool

Interpreting Results in Wireshark (1)

- Port Stamping

- End-of-packet

- Trailer after and of IP packet
 - Minimizes added bytes

- Start-of-packet

- VLAN tag alternative

- Time Stamping

- End-of-packet

- Trailer after and of IP packet
 - Minimizes added bytes

Interpreting Results in Wireshark (2)

- Time and Port Stamps in Trailer example

```
Frame 1: 133 bytes on wire (1064 bits), 133 bytes captured (1064 bits)
Ethernet II, Src: Performa_00:00:02 (00:10:94:00:00:02), Dst: xerox_00:00:01 (00:00:01:00:00:01)

```

Interpreting Results in Wireshark (3)

- Protocol Stripping/De-encapsulation

- GTP Tunneling

- Remove all 3 headers

- MPLS Tunneling

- Remove all labels and/or encapsulation

- VLAN & VN Tagging

- Selectively remove 1, 2, or all tags
 - Remove all or only specific TPID tags

Interpreting Results in Wireshark (4)

- GTP Tunneling example
 - With GTP Encapsulation

```
Frame 1: 524 bytes on wire (4192 bits), 524 bytes captured (4192 bits) on interface 0
Ethernet II, Src: Cisco_2b:4d:40 (00:1a:30:2b:4d:40), Dst: Nokiasie_29:a6:9a (00:40:43:29:a6:9a)

  Internet Protocol Version 4, Src: 10.31.85.1 (10.31.85.1), Dst: 10.34.85.1 (10.34.85.1)
  Transmission Control Protocol, Src Port: 2001 (2001), Dst Port: hosts2-ns (81), Seq: 1, Ack: 1, Len: 56
  Data (56 bytes)
```

Interpreting Results in Wireshark (6)

- VLAN & VN Tagging example
 - With VLAN Tags

```
Frame 1: 126 bytes on wire (1008 bits), 126 bytes captured (1008 bits) on interface 0
Ethernet II, Src: Cisco_df:ae:18 (00:13:c3:df:ae:18), Dst: Cisco_1b:a4:d8 (00:1b:d4:1b:a4:d8)
802.1Q Virtual LAN, PRI: 0, CFI: 0, ID: 118
  000. .... .... = Priority: Best Effort (default) (0)
  ...0 .... .... = CFI: Canonical (0)
  .... 0000 0111 0110 = ID: 118
  Type: 802.1Q Virtual LAN (0x8100)
802.1Q Virtual LAN, PRI: 0, CFI: 0, ID: 10
Internet Protocol Version 4, Src: 10.118.10.1 (10.118.10.1), Dst: 10.118.10.2 (10.118.10.2)
Internet Control Message Protocol
```

- With VLAN Tags Removed

```
Frame 1: 118 bytes on wire (944 bits), 118 bytes captured (944 bits) on interface 0
Ethernet II, Src: Cisco_df:ae:18 (00:13:c3:df:ae:18), Dst: Cisco_1b:a4:d8 (00:1b:d4:1b:a4:d8)
Internet Protocol Version 4, Src: 10.118.10.1 (10.118.10.1), Dst: 10.118.10.2 (10.118.10.2)
Internet Control Message Protocol
```

Interpreting Results in Wireshark (7)

- Conditional Packet Slicing
 - Single out specific packets or traffic types

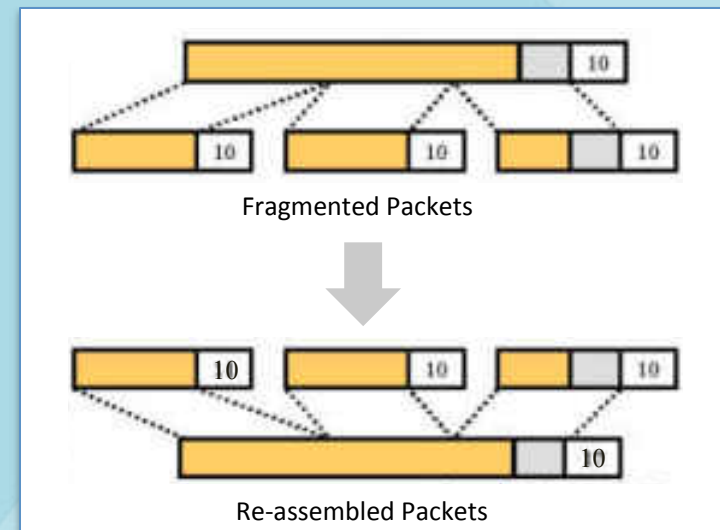

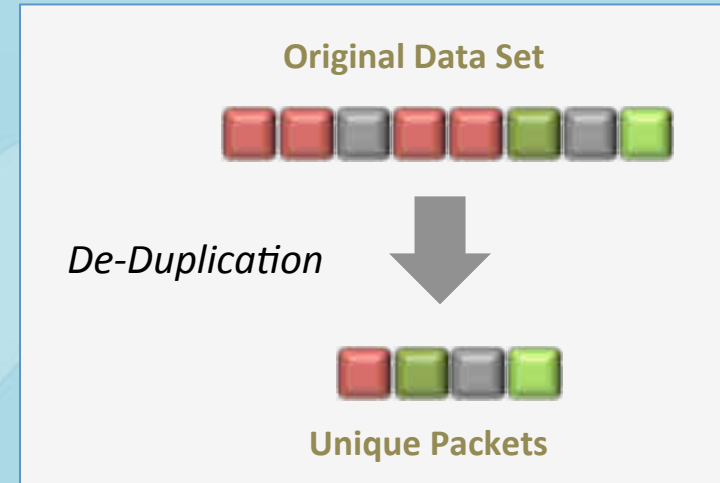

- Slice packet contents from specified point in packets

<add Wireshark decoded vSliced packet>

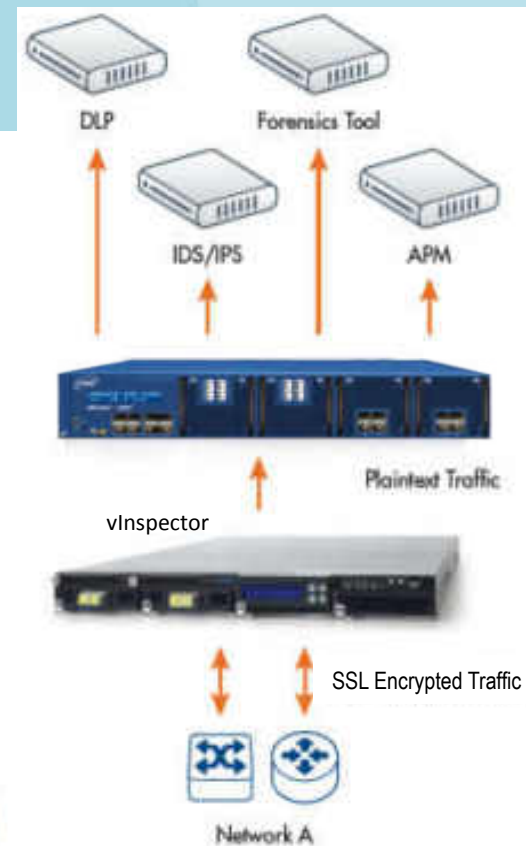

Interpreting Results in Wireshark (8)

- Packet De-duplication
 - Forwards on unique packets
 - Drops all subsequent duplicates with specified time window
 - Expect to see missing sequences
- IP Fragment Reassembly
 - Reassembles “outer” fragments
 - Any IP packet
 - Reassembles “inner” fragments
 - Encapsulated fragmentation, e.g. IP within GTP, IPv4 within IPv6
 - Expect to see missing sequences

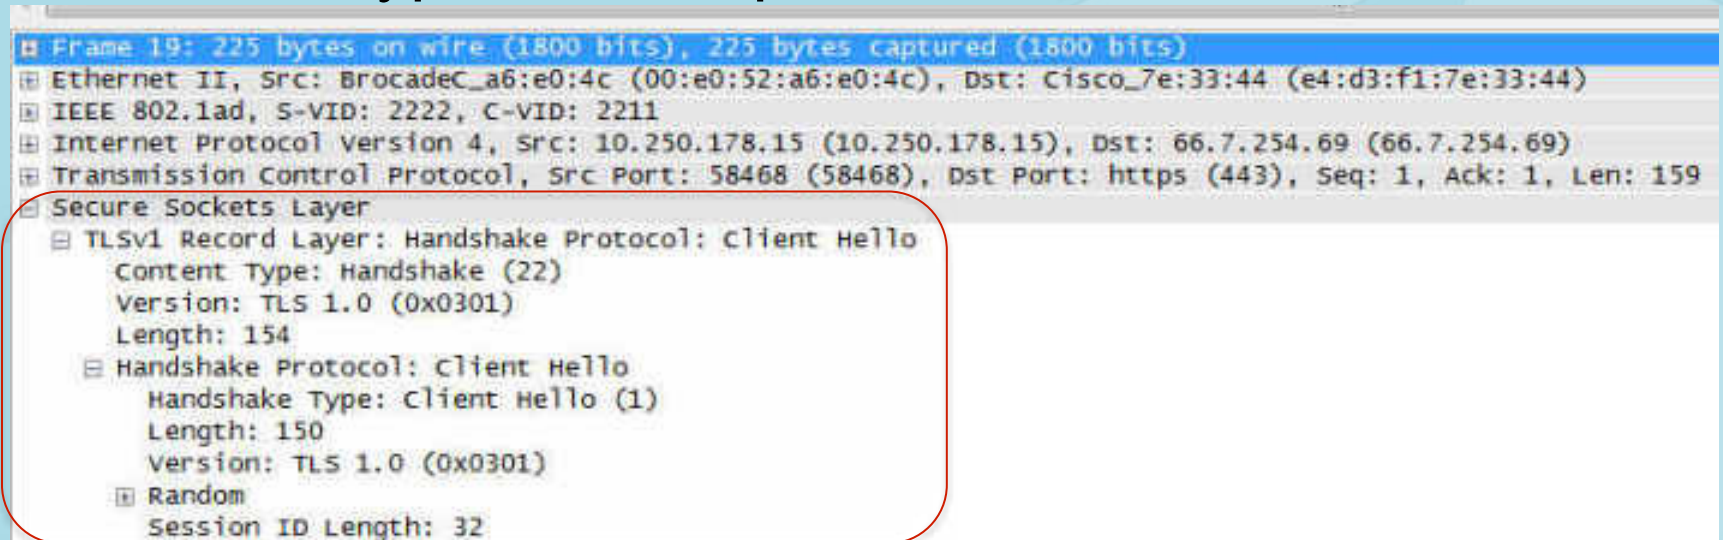

Interpreting Results in Wireshark (9)

- SSL Decryption
 - Detect and decrypt all SSL flows/sessions
 - Forward all clear text/decrypted packets to monitoring & analysis tools

Interpreting Results in Wireshark (9)

- SSL Encryption example

The image shows a Wireshark packet capture window. The top bar indicates 'Frame 19: 225 bytes on wire (1800 bits), 225 bytes captured (1800 bits)'. The packet list pane shows the following layers:

- Ethernet II, Src: BrocadeC_a6:e0:4c (00:e0:52:a6:e0:4c), Dst: Cisco_7e:33:44 (e4:d3:f1:7e:33:44)
- IEEE 802.1ad, S-VID: 2222, C-VID: 2211
- Internet Protocol Version 4, Src: 10.250.178.15 (10.250.178.15), Dst: 66.7.254.69 (66.7.254.69)
- Transmission Control Protocol, Src Port: 58468 (58468), Dst Port: https (443), Seq: 1, Ack: 1, Len: 159
- Secure Sockets Layer
 - TLSv1 Record Layer: Handshake Protocol: Client Hello
 - Content Type: Handshake (22)
 - Version: TLS 1.0 (0x0301)
 - Length: 154
 - Handshake Protocol: Client Hello
 - Handshake Type: Client hello (1)
 - Length: 150
 - Version: TLS 1.0 (0x0301)
 - Random
 - Session ID Length: 32

The TLSv1 Record Layer and its sub-layers are highlighted with a red rounded rectangle.

VSS Portfolio

TAP Series

Standard passive & active Taps for SPAN, in-line regeneration, replication & aggregation

vBroker™ Series

High capacity flexible packet brokers that provide network-wide visibility, data access and optimization for network monitoring and security tools; both passive and active inline.

High Density

Modularity

vInspector™ Series

Bidirectional, high throughput SSL decryption and re-encryption appliances

VSS Management Center (vMC™)

Network-level management console (MC) for managing VSS packet brokers and TAPs, providing network-wide topology views, configuration, policy mgmt, reporting, and administration/updates.

Summary

Monitoring for Performance and Security is absolutely necessary

- But there are challenges...
- Challenges are increasing as network speeds and data increase

Network Packet Brokers are critical to addressing the challenges

- Address most, if not all, challenges

- ▶ **Wireshark can be used with VSS' Network Packet Brokers as an excellent troubleshooting, monitoring, and analysis solution!**
