SharkFest '16

Troubleshooting with Layer 2 Control Protocols

June 15, 2016

Werner Fischer

Principal Networking Consultant | avodaq AG

SharkFest '16 • Computer History Museum • June 13-16, 2016

Agenda

- Background
- Gotchas and Challenges with Layer 2 Control Protocols (L2CP)
- Layer 2
 - LACP
 - UDLD
 - Configuration Test Protocol (loopback)
 - Ethernet Flow-Control
- Between the lines
- Wrap-up

About me

- From Germany (sorry the accent)
- More than 10 year Dual-CCIE (R/S, Security)
- Sniffer Certified Master
- Wireshark Certified Network Analyst
- VMware Certified Professional
- IPv6 Forum Certified Engineer (Gold)
- More than 18 years in the networking area

My first data network analyzer

Wandel & Goltermann DA-30C – still working ☺

SharkFest '16 • Computer History Museum • June 13-16, 2016

Gotchas & Challenges with L2CP

Capture Files:

https://app.box.com/v/sharkfest2016-layer2

Interference

Physical Layer (1)

Data Link Layer (2)

Network Layer (3)

Transport Layer (4)

BTW - what is a Link with Ethernet?

- Speed
- Duplex
- MTU
- Auto-Negotiation
- Flow-Control
- MDI/MDI-X
- Remote-Fault / Local-Fault / FEFI
- Carrier-Delay
- Debounce Timer
- EEE

Challenge 1 - Different kind of links

Copper

• 10/100/1000/10000 traffic

Fiber

- 10BASE-FL
- 100BASE-FX
- 1000-BASE-X
- 10G/40G/100G

• ...

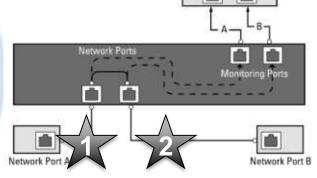

Challenge 1.1 - Copper links

- Copper 10/100/1000/10000 traffic
- Taps Gotchas
 - The Tap negotiates separately with each side of the full-duplex link
 - One Link before with Tap two Links segments
- SPAN Gotchas

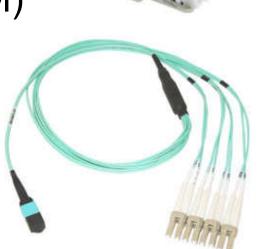

```
SW_2520(eth-25) # monitor
25: Cannot monitor a dynamic LACP trunk.
SW_2520(eth-25) #
```

- Link Loss Carry Forward or Link Failure Propagation
- PoE (e.g for 802.11ac Wave 1 and Wave2 APs)

Challenge 1.2 - Fiber Links

- Duplex/Simplex
- Single strand BiDi
- Power Level / Split Ratio
- Multi-Wavelength Tap (CWDM/DWDM)
- Taps the best for single data stream
 - Passive Optical Fiber TAPs
- QSFP+
 - BiDi Transceiver
- CFP, CFP2, CFP4, CXP
- SPAN Gotchas

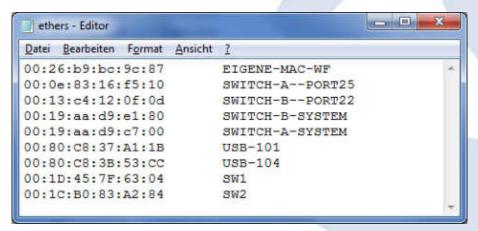

Challenge 1.3 – DAC & AOC

- Direct-Attach Cable
 - also known as a twinax cable
- Active Optical Cable (AOC)

Challenge 2 – Display Environment

- Know your MAC-Addresses and write it down
- Use aliases and well-known names

Use Profiles

Challenge 3 – General

Location

- Local versus different Data centers
- LAN versus WAN / MAN
- Layer 2 VPNs
- Virtualization
- Time stamping / correlation
- Cluster Systems
 - Multi-Chassis
 - Fabrics

Time for Questions

Link Aggregation Control Protocol (LACP)

Link Aggregation Control Protocol (LACP)

- What is LACP?
 - A Layer 2 protocol to logically bundle multiple physical ethernet links into one

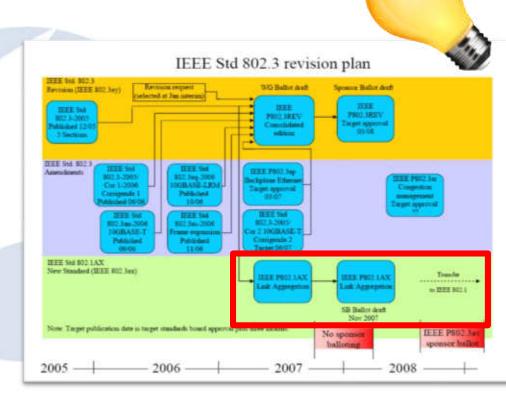

- for increasing bandwidth and build-in redundancy
- · Who need it?
 - Everyone from the networking field
- Benefits?
 - Failover, load-sharing, acting as one
- Requirements
 - "... all interfaces in the channel group must be the same type and speed"

LACP Standards

- IEEE Std 802.3, 2000 Edition Clause 43
 - 802.3ad
- IEEE Std 802.1AX™-2008
 - 802.1AX not 802.3ax
- IEEE Std 802.1AX™-2014
 - Revision of IEEE Std 802.1AX-2008

Terms

- Link Aggregation
- Link Aggregation Group (LAG)
- Link Aggregation Control Protocol (LACP)
- Link Aggregation interface
- Member interface (member link)
- Active, inactive and standby interfaces
- Aggregator port
- Actor / Partner
- Active / Passive
- Upper / Lower threshold for the number of active interfaces

LACP Requirements

- "... all interfaces in the channel group must be the same type and speed"
- "... as either Layer 2 or Layer 3 interfaces"
- the interfaces that participate in a Port-Channel can include both the copper and fiber-optic ports
- interface attributes

- Really nothing forgotten?
 - Please remember the Slide "what is a Link with Ethernet"

LACP Notes

- Link Aggregation Control and Marker Protocols are encoded with Ethertype
 - 0x8809
 - Destination Multicast MAC Address: 01-80-C2-00-00-02
- multiple physical links to provide a single logical link between exactly two entities
- in LACP there is no explicit confirmation from a neighbor that he had received LACPDU
- LACP selects a port for each frame

LACP Load-Balancing

- IPv4 packets
- IPv6 packets
- MPLS packets
- Layer 2 Frames except IPv4, IPv6 and MPLS packets
 - TRILL packets
 - FCoE packets
- → The Load-Balancing code is platform dependent and most use a hashing algorithm by the LAG
- → LACP isn't "additive", it's a LB mechanism!

SharkFest '16 • Computer History Museum • June 13-16, 2016

Load-Balancing - Values in the frame/packet header

- Source MAC address
- Destination MAC address
- Source IP address
- Destination IP address
- Source port
- Destination port
- IPv6 Flow label
- MPLS label(s)

LACP – Marker Protocol

- Marker Generator
- Marker Responder
- Wireshark can dissect it
- The 802.3ad standard also provides two methods to ensure that packets are not disordered when moving conversations.
 They are time-outs and the Marker Generator
- Never captured by me and I capture very often

 SharkFest '16 Computer History Museum June 13-16, 2016

LACP – Marker Protocol

IEEE Standard versus Dissection

```

Capturing LACP

Keep all your capture points in time sync

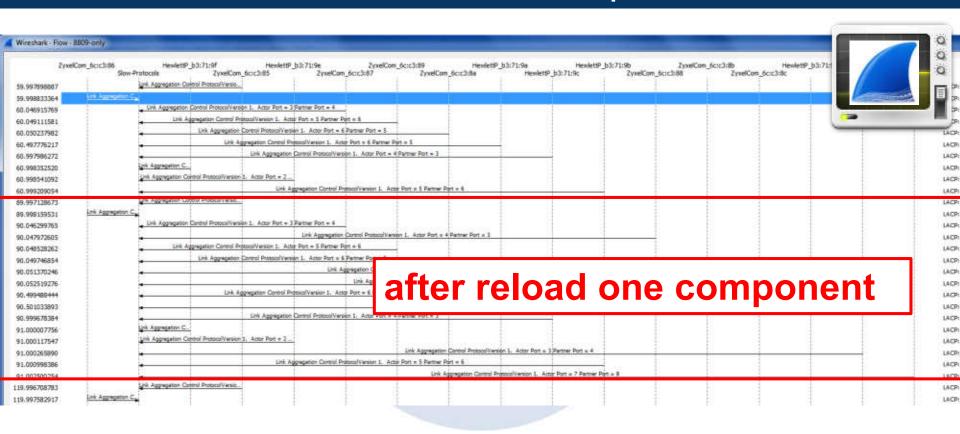

Capturing LACP - Reality

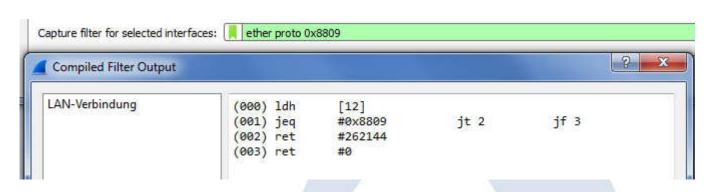

- Lab Environment
- The Hardware Ethernet Analyzers provides different methods to capture packets inline and full-duplex.
- Copper or Fiber up to Gigabit
- Wireshark used for further analysis

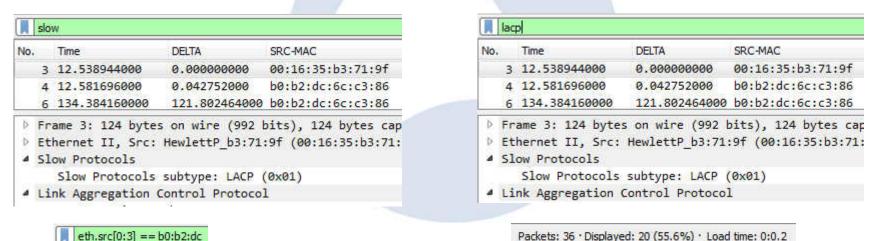

LACP - Flow Graph

LACP – Capture and Display Filter

- LACP Actor Flags

LACP Flags: **DCSG*A

▼ LACP Partner Flags

LACP Flags: **DCSG*A

See Lua Script "TCP Flags for Wireshark" by Didier Stevens - modified for LACP

LACP – System-ID

```
Link Aggregation Control Protocol

LACP Version Number: 0x01
Actor Information: 0x01
Actor Information Length: 0x14

Actor System Priority: 32768
Actor System: SWITCH-A-SYSTEM (00:19:aa:d9:c7:00)

Actor Key: 10
Actor Port Priority: 32768
Actor Port 274

Actor State: 0x7d, LACP Activity, Aggregation, Synchronization, Collecting, Distributing, Defaulted Reserved: 000000
```

System-ID

System-ID = System Priority plus System MAC address

- The endpoint with the lower System-ID makes the decision about which ports are actively participating in the port-channel at any given time.
- The lower the value becomes the Actor and determines the links between the LACP partner switches that are in active and standby states for each LACP port channel.
- When the System Priority is same, the device with lower System MAC will have higher system-priority.

LACP – Actor Key

Link Aggregation Control Protocol LACP Version Number: 0x01 Actor Information: 0x01 Actor Information Length: 0x14 Actor System Priority: 32768

Actor System: SWITCH-A-SYSTEM (00:19:aa:d9:c7:00)

Actor Key: 10

Actor Port Priority: 32700

Actor Port: 274

Actor State: 0x7d, LACP Activity, Aggregation, Synchronization, Collecting, Distributing, Defaulted

Reserved: 000000

Actor Key

- Value assigned to aggregator ports and physical ports that are candidates for joining a LAG.
- Only ports with matching keys are allowed to aggregate.

KEY

LACP – Port-ID

Link Aggregation Control Protocol

LACP Version Number: 0x01 Actor Information: 0x01

Actor Information Length: 0x14 Actor System Priority: 32768

Actor System: SWITCH-A-SYSTEM (00:19:aa:d9:c7:00)

Actor Key: 10

Actor Port Priority: 32768

Actor Port: 274

Actor State: 0x7d, LACP Activity, Aggregation, Synchronization, Collecting, Distributing, Defaulted Reserved: 000000

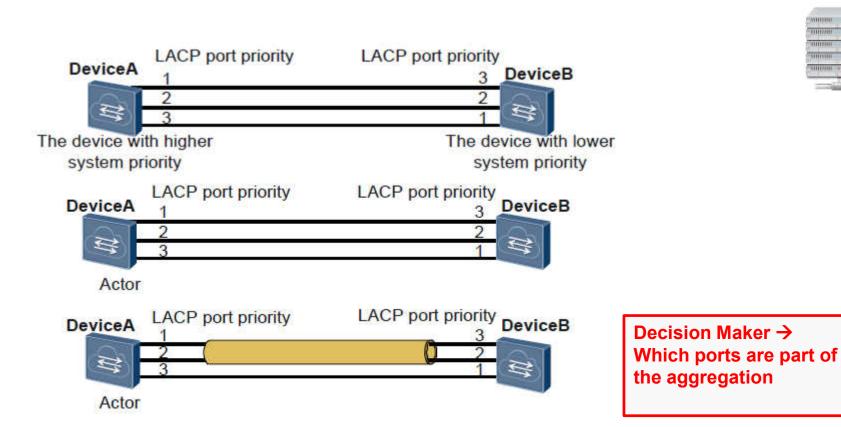

Port-ID = Port Priority plus Port Number

- The lower the range of the Port-ID, the more likely that the interface will be used for LACP transmission
- Port Priority decides which ports should be put in standby mode when there is a limitation that prevents all compatible ports from aggregating and which ports should be put into active mode.

Port-ID

LACP – Actor Election

```

MC-LAG with LACP

- MC-LAG LAG terminate on separate chassis
- MC-LAG is not covered under IEEE standard
- Multi-homing for redundancy
- Active-active to utilize all links which otherwise may get blocked by Spanning-Tree
- no modification of LAG partner
- Temporary loops or duplicates not acceptable
- Split brain handling
- One the way for multi-vendor implementation

MC-LAG – different vendors – different names

- Cisco:
 - StackWise
 - Virtual Switching System (VSS)
 - Virtual Port Channel (vPC)
- Juniper
 - Virtual Chassis (VC)
- HP
 - Intelligent Resilient Framework (IRF)
- Extreme Networks
 - Inter-Switch-Connection

- Force 10
 - Virtual Link Trunking
- Avaya (Nortel)
 - Split multi-link trunking
- Cumulus Networking
 - Multi-Chassis Link Aggregation
- Arista Networks
 - MLAG
- ... and many others

MC-LAG with LACP

Every two seconds from the link partner

Time for Questions

Unidirectional Link Detection (UDLD)

UDLD Basics

Cisco UDLD feature is documented in RFC 5171

INFORMATIONAL

Network Working Group
Request for Comments: 5171
Cisco Systems
Category: Informational
Cisco Systems UniDirectional Link Detection (UDLD) Protocol

- Different names and implementations
 - Device Link Detection Protocol (DLDP)
 - D-Link Unidirectional Link Detection (DULD)
- Three Paket Formats
 - Probe
 - Echo
 - Flush

UDLD Basics

- Many vendors have their own proprietary solution
 - LACP protocol in a single member LAG
 - Own Ethertype
- Layer 1 "fault" indication is the "loss of light"
- Why it is needed we use Auto-Negotiation with Remote-Fault?
 - Different wavelengths of optical signaling (10/100/1000)
 - EoSDH
- Used for miswiring detection

Cisco UDLD Notes

 Cisco UDLD are encoded with LLC, standard Subnetwork Access Protocol (SNAP) format and Protocol ID 0x111

- Destination Multicast MAC Address: 01:00:0C:CC:CC
- Fast Hello enhancement available

UDLD Modes

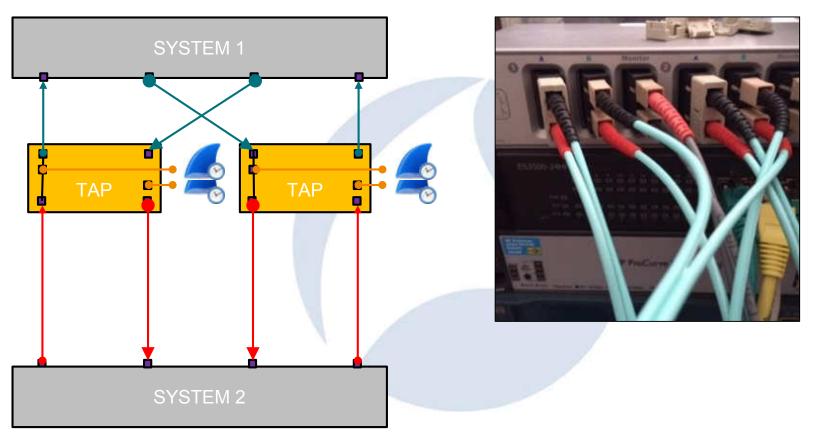

Aggressive Mode:

 UDLD will declare link as unidirectional and will disable interface, if no reply has been received for subsequent 8 PDU message transmitted at an interval of 1 sec.

Normal Mode:

 Link will be disabled immediately if PDU reply has not been received within predefine timeout interval.

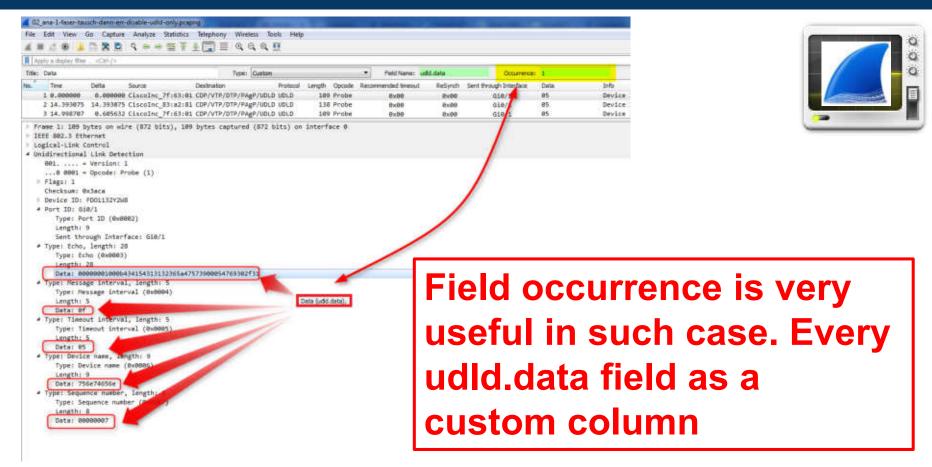

UDLD Capture

Loop Detection Protocols

CTP from the archive

ETHERNET SPECIFICATION: Configuration Testing Protocol

8. ETHERNET CONFIGURATION TESTING PROTOCOL

The Ethernet Configuration Testing Protocol provides a minimum testing capability of communication between stations on an Ethernet. It is the only Client Layer protocol specified in this document and has the only assigned Ethernet type field value in this document. All Ethernet stations must support the configuration testing functions.

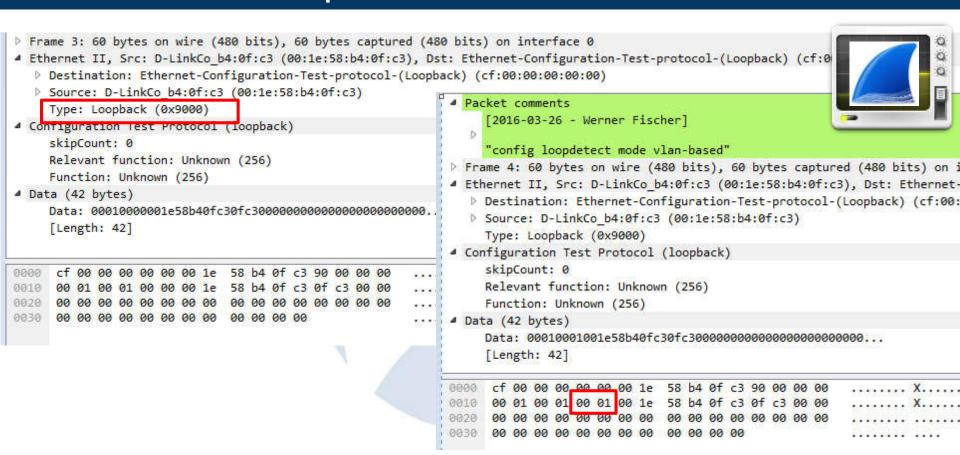

8.1 Goals

For more information see http://www.mit.edu/~jhawk/ctp.pdf

Loopback from the field

Loop Detection Protocols

SharkFest '16 • Computer History Museum • June 13-16, 2016

Loop Detection Protocols

- Every vendor has it own solution
 - TLV coded

1	1	0	0	Disable PAUSE Transmit and Receive	Disable PAUSE Transmit and Receive
1	1	0	1	Enable PAUSE receive, Disable PAUSE transmit	Enable PAUSE transmit, Disable PAUSE receive
1	1	1	-	Enable PAUSE Transmit and Receive	Enable PAUSE Transmit and Receive

SharkFest '16 • Computer History Museum • June 13-16, 2016

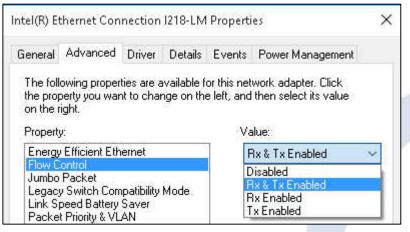

Ethernet Flow-Control

 Depending on the bandwidth of the link, the PAUSE frames are sent at a specific interval of time.

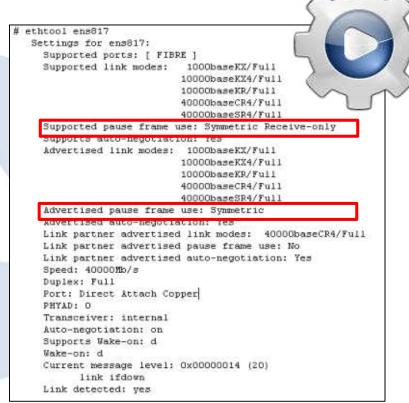

- The PAUSE time is measured in units of PAUSE "quanta" and is defined to be 512 bit times
 - Fast Ethernet 5.12µs, 0.512µs for Gigabit Ethernet, 0.0512µs for 10-Gigabit Ethernet, 0.0128µs for 40-Gigabit Ethernet and 0.00512µs for 100-Gigabit Ethernet (e.g. 512Bits/1.000.000.000Bit/sec for GE)
- \bullet 65535*512/1.000.000.000 = 0.03355392 seconds
 - = 33.55ms.

Flow-Control Challenges from the field

Strange Flow-Control Implementation

SharkFest '16 • Computer History Museum • June 13-16, 2016

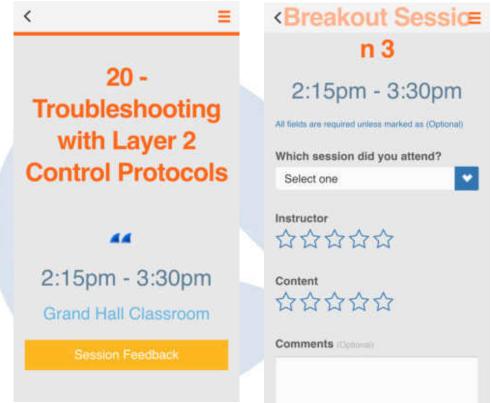

Time for Questions

Session Summary

- Wireshark's capabilities of dissection, filtering and others will help your analysis in a Layer 2 environment
- Pay attention to the capture points and any data that could be used as a "signature" to correlate traces with Layer 2 events
- Time sync of all capture points is a must
- Read standards from IETF / IEEE / MEF reflex and ask yourself what's going on the wire here

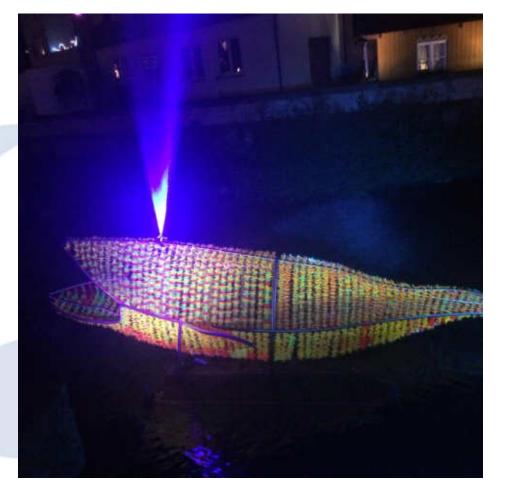

Please provide Session Feedback
